

Wise Waste Disposal

In this picture we are seeing these four different bins that are all messed up, because people are not taking good care of them. To avoid this we could dispose of waste more wisely. One way how to do this is by following the 3R's that are, recycle that means to separate waste, to reduce that means to decrease more waste and to reuse that means to use the waste again, for another time.

The problem of waste had increased in all kinds of waste in the Maltese Islands and it had grown tremendously. Some of these reasons are because products have a shorter life, most of the products are packed in excessive packing, and because people are wealthier and prefer to replace their old goods with new one's.

Another Way to dispose waste wisely is that the EU principles are working on waste:

Prevention: Waste Production should be minimized and avoided as much as possible.

Polluter Pays Principle: Those who contaminate the environment should be fined.

The Precautionary Principle: To as possible prevent potential waste problems.

The Proximity Principle: Waste should be disposed closely to where it is produced.

Conclusion:

Finally, all we can say is that people should take care of the environment and should recycle for a better life. Bring-in-sites bins should always be cleaned and there should be no vandalism.
